

I was given two months to live

- a year later, I'm cancer-free

FURTHER to the recent letter in the Guernsey Press by a lady who has had a successful result using GcMAF, I would like to add my own endorsement of this treatment due to my remarkable 'recovery' from grade four metastasised cancer to the liver. Having two devastatingly attractive men gazing in astonishment at my naked breasts might have been something I would have relished previously – but on this day, 4 September 2012, they were top Belgian oncologists and the diagnosis was terminal cancer. The object of their astonishment was a large black lump that had begun to protrude from my right breast and was 'fit to burst'. Subsequent tests showed this was a malignant breast cancer that had metastasised to the liver and the prognosis was 'two months to live'. So why was I so shocked? Why hadn't I done anything about this before? – as my distraught family shouted at me. The answer to these questions was that I had had the lump tested when it first appeared in 1996 and was told I had

cystic breasts and that this was just a cyst and not to worry about it. It may get bigger but wouldn't kill me and would just need removing at some stage. I was assured that cysts don't turn cancerous as they are a different species altogether and I reasoned that if it was going to kill me, it would have done so by now. The treatment advised in Belgium was palliative chemo, which I decided against as the liver was too badly affected and my quality of life for two months would have been degraded by having chemo. I decided to have a last family holiday in my remaining time and, along with my sister, her husband, my two nephews and my two daughters, we booked a month in Cyprus. Both my parents had died of cancer, my father of lung cancer in 1975 and my mother of breast cancer in 1998 and in all that time, I was surprised that with all the money spent on cancer research, there were still no accepted alternative treatments other than chemotherapy, which is a poison, or radiology. I know this treatment to be extremely 'heroic' with awful side effects and, certainly in

the cases of my parents, didn't result in a cure. Meanwhile, I was advised to look up www.gcmf.eu on the internet. GcMAF is essential to our immune system and all healthy people have it. To establish itself, cancer first needs to destroy our own natural GcMAF to collapse our immune system and prevent its 'macrophages' from 'eating' the cancer and destroying it. Apparently this happens every day in healthy people. A Guernsey company called Immune Biotech has found a way of isolating the GcMAF molecules (a human protein) in healthy people into a vaccine that could then be injected into a cancer-ridden person. There are copious scientific papers proving its efficacy and it is being used in private clinics across Europe and in America. I decided to order some and started taking it last October. They told me I would be cancer-free in a year. After the 'last holiday', there followed a 'last birthday' celebration then a 'last Christmas' etc., until I began to feel like a fraud as I appeared and looked to be in perfect health, living life to the full.

My family were fussing round me, 'are you sure you aren't tired, Mum?' and by that time I had resumed my routine of circuit training once a week and cycling everywhere with no apparent side effects and my energy levels seemed as good as ever. I was invited by Immune Biotech to attend a conference in Frankfurt, Germany, where I met many doctors and scientists with hundreds of proven patient case histories showing cures with GcMAF. One particular man from Australia did a very inspiring talk after being diagnosed with metastasised bowel cancer. His life assurance paid out as he was close to death. Then he took GcMAF and cured himself in eight months, but gets to keep the insurance payout. The doctors and scientists there were very interested in my case, particularly as I hadn't had any treatment other than GcMAF. In July 2013, I had blood tests in the UK, which showed that my liver function had returned to normal. In August, I had a Cat scan, which proved I was cancer free, a month before

Immuno Biotech's promise. The cancer specialist is amazed at my recovery after giving me a thorough examination. Naturally, I'm extremely grateful to Immune Biotech and its director David Noakes for this treatment and can't understand why, when they publish their incredible results, they get pilloried here. One course of chemo can cost £30,000, so I suppose this is a huge industry that is not going to 'lie down and die'. I also can't understand why doctors still insist on prescribing chemo when it is an acknowledged fact by the industry and doctors (see 'the history of chemotherapy' on the internet) that chemo is ineffective once cancer has metastasised – it seems to me that they are the ones 'peddling hope' and making a huge profit out of it. Unfortunately, David Noakes, who generously offered to provide Guernsey with GcMAF without charge (it has no side effects), has been turned down by the authorities and is setting up in Switzerland. What a sad outcome for the island and what a wasted

opportunity for the people of Guernsey.
